## B • Academic History

### 1. Research Endeavours

My research and publications are trying to answer 3 key questions related to women's brain health:

- a. *Why do more women than men have Alzheimer's disease? Effects of Mid-life Estradiol Withdrawal*—Cognitive and Brain Changes in women with oophorectomy prior to natural menopause: This is a study of the effects of estrogen withdrawal in women with the breast cancer mutation (BRCA 1/2). It involves neuropsychological testing, brain imaging, APOE genotyping, hormone measurement, immune system response, inflammation, and stress. Experiments are ongoing. We also study the effects of oophorectomy on sleep, and sense of self and have expanded our questions to understand the role of modifiable and unmodifiable risk factors in large data sets. The work includes numerous reviews, data papers, and the greater part of the lab trainees.
- b. *How do the activating effects of hormone therapy affect aging and cognition in Trans-Individuals*—Study of the effects of hormone (testosterone and estradiol) treatment on cognition in male and female transsexuals. The work includes a book chapter, conference presentations, one paper published, one under revision, and a postdoctoral fellow recruited.
- c. *How do culture and pain instantiate themselves into the nervous system?*
  - i. In Elderly Immigrant Indian Women: One qualitative study on pain has been published; two more are being drafted.
  - ii. In Somali-Canadian women and pain: four publications including a hypothesis paper, review chapter, qualitative interviews, and very mixed methods studying pain and pleasure.
  - iii. In Somali-Canadian women and response to obstetric-gynecological care: three papers drafted

and submitted.

This work has been carried out primarily by public health graduate students and forms a relatively large corpus on gender and health.

- d. *How can we study Sex and Gender together to understand how the social becomes biological?* In collaboration with colleagues at CIHR, NIH, Organization for the Study of Sex Differences, and Stanford. Paper published on a new instrument for measuring gender; Canadian Organization Gender and Sex (COGS) Research established; Lead on the Women, Sex, Gender, and Dementia Program, Canadian Consortium on Neurodegeneration and Aging; produced invited book chapter and drafting manuscript on *Sex and Gender Science*.

## F • Other Relevant Information

### 1. General Direction of Research

An underlying assumption of my work is that the adult central nervous system is plastic and particularly responsive to circulating steroid hormones as well as to experience. This approach combines cognitive/systems neuroscience, neuroendocrinology, public health, and women's health. In the long term, the approach will be important for understanding chronic disease as well as the health of women. We use convergent methods—integrating psychological tests (e.g., of memory and pain response), genetic tests, steroid hormone assays, in vivo imaging, and qualitative interviews.

All projects involve graduate students in the Psychology Dept. and the Dalla Lana School of Public Health. In addition, projects are conducted in collaboration with colleagues at Linköping University (Sweden), both from Tema Genus in the Faculty of Arts and Science and from IKE within the University Hospital Medical Faculty as well as at McGill University. All my projects take the perspective of what I call, *Situated Neuroscience*, integrating contextually-dependent social and physiological factors and taking the view that there is a reciprocal relationship between the social and the biological.

I believe that it is important to let the public know about our findings, what the University of Toronto is doing with respect to women's health, and about this perspective of the integration of the social with the biological. Therefore, I engage with journalists when they ask for an interview.
